

Statement a cubic surface
contains 27 lines.

Main topic:

Grassmannian

for r, n $\text{Gr}(n, r)$ as
a set = the set of r -
dimensional ^{linear} subspaces in \mathbb{C}^n .

equivalently is the set of
 $r-1$ dimensional projective subspaces
in the $n-1$ dimensional projective
space.

So for example projective
lines in \mathbb{CP}^3 are parametrized
by $\text{Gr}(4, 2)$.
Another example $\mathbb{CP}^n = \text{Gr}(n+1, 1)$.

Plan

- 1) Understand the geometry
- 2) compute cohomology
- 3) construct interesting vector
bundles
- 4) convert counting questions
to computation with Chern
classes
- 5) Get identities from Riemann-
Roch.

1) Geometry of $\text{Gr}(n, r)$.

Cell decomposition:

Suppose $V \subset \mathbb{C}^n$ $\dim V = r$.

Pick a basis of $V = r$ vectors

$v_1, \dots, v_r \in \mathbb{C}^n$.

Conversely, any collection v_1, \dots, v_r

linearly indep. gives such V

$V = \text{Span}(v_1, \dots, v_r)$.

Problem: many ways to choose a basis.

$(v_1, \dots, v_r) \xrightarrow{\text{many to 1.}} V$

We want $1 \leftrightarrow 1$ correspondence.

To do it let v_1 be

such that

$$v_1 = (v_{11}, v_{12}, \dots, \underbrace{1, 0, \dots, 0}_{\text{as many zeros as possible}})$$

so $v_{1k_1} = 1$ $v_{1i} = 0$ $i > k_1$

k_1 is as small as possible.

What about v_2 ?

$$v_2 \neq \lambda v_1 \quad (\lambda \in \mathbb{C})$$

also choose v_2 s.t.

$$v_{2k_2} = 1 \quad v_{2i} = 0 \quad i > k_2$$

Of course, $k_2 > k_1$. (otherwise v_2 would be v_1)

so on. produce v_3, \dots

is v_2 unique?

v_2, v_2' $v_2 - v_2'$ has more zeros at the end

$v_2 - v_2'$ must be proportional to v_2 .

Let us assume further that

$$\boxed{v_{2k_2} = 0}.$$

Now v_2 is unique. Proceeding this way we obtain a sequence

$v_1, \dots, v_r \in \mathbb{C}^n$, and a sequence $k_1, \dots, k_r \in \mathbb{Z}$. s.t.

$$v_{ik_i} = 1 \quad v_{ij} = 0 \quad (j > k_i)$$

$$v_{ik_i} = 0 \quad (i < k_i).$$

Claim a collection satisfying

these assumptions is unique.

Proof homework.

$$V \rightarrow v_1, \dots, v_r \quad \begin{array}{l} \text{canonical} \\ \text{basis} \end{array}$$

$$k_1, \dots, k_r$$

For each increasing sequence $1 \leq k_1 < k_2 < \dots < k_r \leq n$

let $\Omega_{k_1, \dots, k_r} \subset \text{Gr}(n, r)$ be the

set of subspaces V which produce

v_1, \dots, v_r , k_1, \dots, k_r with given

k_1, \dots, k_r by the above construction.

How does Ω_{k_1, \dots, k_r} look like?

Ω_{k_1, \dots, k_r} looks like $\mathbb{C}^{\# \text{ of free variables}}$

$$\mathbb{C}^{N_{k_1, \dots, k_r}}$$

$$N_{k_1, \dots, k_r} = \#\{(i, j) \mid v_{ij} \text{ is allowed}\}$$

$$\text{to take any value}$$

$$\Leftrightarrow j < k_i \quad j \neq k_i, \quad i < i.$$

$$N_{k_1, \dots, k_r} = \sum_{i=1}^r (k_i - 1) - (i - 1) = \sum_{i=1}^r k_i - i.$$

Examples

1) $r=1$ we have $\star = \text{anything}$

$$\Omega_1 = \{(1, 0, \dots, 0)\} \quad k_1 = 1$$

$$\Omega_2 = \{(\star, 1, 0, \dots, 0)\} \quad k_2 = 2$$

$$\Omega_3 = \{(\star, \star, 1, 0, \dots, 0)\} \quad k_3 = 3$$

2) $r=2, n=4$

$$(k_1, k_2) = (1, 2), (1, 3), (1, 4),$$

$$(2, 3), (2, 4), (3, 4)$$

$$\Omega_{k_1, k_2} \quad (1, 2) : \quad v_1 = (1, 0, 0, 0) \quad \text{only}$$

$$v_2 = (0, 1, 0, 0) \quad \text{are } V$$

$$(1, 3) : \quad v_1 = (1, 0, 0, 0) \quad (\star)$$

$$v_2 = (0, \star, 1, 0)$$

$$(1, 4) : \quad v_1 = (1, 0, 0, 0) \quad (\star)$$

$$v_2 = (0, \star, 0, 1)$$

$$(2, 3) : \quad v_1 = (\star, 1, 0, 0) \quad (\star)$$

$$v_2 = (\star, 0, 1, 0)$$

$$(2, 4) : \quad v_1 = (\star, 1, 0, 0) \quad (\star)$$

$$v_2 = (\star, 0, 1, 1)$$

$$(3, 4) : \quad v_1 = (\star, \star, 1, 0) \quad (\star)$$

$$v_2 = (\star, \star, 0, 1)$$

$$\dim V = 2, \quad V \subset \text{span}(e_1, e_2, e_3) \Rightarrow$$

Denote $\underline{k} = (k_1, \dots, k_r)$

$$I_{n,r} = \{ \underline{k} \mid 1 \leq k_1 < \dots < k_r \leq n \}$$

then $Gr(n, r) = \bigcup_{\underline{k} \in I_{n,r}} \Sigma_{\underline{k}}$

$\Sigma_{\underline{k}}$ are called cells.
(Schubert cells).

How to put a structure of a manifold on $Gr(n, r)$?

The big cell is $\Sigma_{\underline{k}} \quad \underline{k} = (n-r+1, \dots, n)$.

equivalently $k_1 = n-r+1$, equivalently

$$\forall v \in \text{big cell} (\Rightarrow \bigvee \Lambda^k \text{Span}(e_1, \dots, e_{n-r}) \underset{\substack{\parallel \\ \{0\}}}{\text{or}})$$

Prop

For any V there exist a basis of \mathbb{C}^n w.r.t. which V is in the big cell.

Proof clear.

So big cells for different choices of basis in \mathbb{C}^n cover $Gr(n, r)$, we can use big cells to construct charts on $Gr(n, r)$, (remember cells look like affine spaces

$$\text{big cell} \cong \mathbb{C}^N \cong \mathbb{C}^{(n-r)r} \cong \mathbb{R}^{2(n-r)r}$$

$$\begin{aligned} N &= (n-r+1-1) + (n-r+2-2) + \dots = \\ &= (n-r) \cdot r \end{aligned}$$

\hookrightarrow homology of $\text{Gr}(n, r)$.

$$\text{Prop } \overline{\mathcal{O}_{\underline{d}}} = \bigcup_{\underline{d}' \leq \underline{d}} \overline{\mathcal{O}_{\underline{d}'}}$$

certain order \leq on $\text{I}_{n,r}$.

Proof

$$\text{if } V \in \overline{\mathcal{O}_{\underline{d}}} \Rightarrow$$

$$\dim(V \cap \text{span}(e_1, \dots, e_{d_1})) \geq 1$$

$$\dim(V \cap \text{span}(e_1, \dots, e_{d_2})) \geq 2 \quad (\star)$$

$$\dim(V \cap \text{span}(e_1, \dots, e_{d_r})) \geq r.$$

$$\overline{\mathcal{O}_{\underline{d}}} = \{V \mid \text{satisfying } (\star)\}.$$

Suppose conversely V satisfies (\star) .

$$V \in \overline{\mathcal{O}_{\underline{d}'}} \text{ then:}$$

$$d'_1 \leq d_1$$

$$d'_2 \leq d_2$$

so for the order $d' \leq d$ it

$$d'_i \leq d_i \text{ the}$$

statement holds. \square

Let's list all the cells

$$\overline{\mathcal{O}_{\underline{d}_1}}, \dots, \overline{\mathcal{O}_{\underline{d}_m}} \text{ so that}$$

for $i < j$ then $\underline{d}_i < \underline{d}_j$.

$$\text{Let } X_i = \bigcup_{i \leq i} \overline{\mathcal{O}_{\underline{d}_i}}.$$

$$X_1 \subset X_2 \subset \dots \subset X_m = \text{Gr}(n, r).$$

$X_i / X_{i-1} =$ Sphere of dimension

$$2(\sum d_j - i) \text{ where}$$

$$\underline{d} = \underline{d}_i.$$

$$\text{Hence } H^k(X_i, X_{i-1}, \mathbb{Z}) = \begin{cases} \mathbb{Z} & k \neq 2(\sum d_j - i) \\ 0 & \text{otherwise.} \end{cases}$$

by long exact cohomology sequence

$$2(\sum d_j - i) \text{ is even!}$$

we get:

$$H^k(\text{Gr}(n, r), \mathbb{Z}) = \begin{cases} 0 & k \text{ is odd} \\ \mathbb{Z}^{\#d : \underline{d}_i = \frac{k}{2}} & k \text{ even.} \end{cases}$$

Ex

$\text{I}_{4,2}$:

$$\overline{\mathcal{O}_{1,2}}, \overline{\mathcal{O}_{1,3}}, \overline{\mathcal{O}_{1,4}}, \overline{\mathcal{O}_{2,3}}, \overline{\mathcal{O}_{2,4}}, \overline{\mathcal{O}_{3,4}}.$$

X_1

X_2

X_3

X_4

$$\overline{\mathcal{O}_{2,3}} = \overline{\mathcal{O}_{2,3}} \cup \overline{\mathcal{O}_{1,3}} \cup \overline{\mathcal{O}_{1,2}} \quad (\text{don't have})$$

$$\overline{\mathcal{O}_{2,4}} = \left(\begin{array}{c} \overline{\mathcal{O}_{2,3}} \text{ (plane)} \\ \overline{\mathcal{O}_{1,3}} \text{ (line)} \\ \overline{\mathcal{O}_{1,2}} \text{ (point)} \end{array} \right) \cup X_3 \quad \overline{\mathcal{O}_{3,4}}$$

$$X_4 / X_3 = \left(\begin{array}{c} \overline{\mathcal{O}_{2,3}} \text{ (plane)} \\ \overline{\mathcal{O}_{1,3}} \text{ (line)} \\ \overline{\mathcal{O}_{1,2}} \text{ (point)} \end{array} \right) \cup X_3 \quad \text{Collapsed}$$

$$\overline{\mathcal{O}_{3,4}} \quad H^8 = \mathbb{Z}$$

$$\text{Gr}(4, 2): \quad \overline{\mathcal{O}_{2,4}} \quad H^4 = \mathbb{Z}^2$$

$$\text{planes} \quad \overline{\mathcal{O}_{1,4}} \quad \overline{\mathcal{O}_{2,3}} \quad H^2 = \mathbb{Z}$$

$$\text{lines} \quad \overline{\mathcal{O}_{1,3}} \quad H^1 = \mathbb{Z}$$

$$\text{Point} \quad \overline{\mathcal{O}_{1,2}} \quad H^0 = \mathbb{Z}$$
